## // STACK

|            |              |         |
|------------|--------------|---------|
| C#         | ASP.NET Core | EF Core |
| React      | TypeScript   | Vite    |
| HTML / CSS | REST API     | Swagger |
| SQL        | Git / GitHub | Jira    |

## // ARCHITECTURE

- > Clean Architecture
- > Onion Architecture
- > Modular Monolith
- > Domain-Driven Design
- > CQRS fundamentals
- > Repository refactoring

## // PROFESSIONAL

- > Requirements gathering
- > Client discovery
- > BRD authoring
- > Technical documentation
- > MVP planning
- > UI alignment & refinement
- > Debugging & cleanup
- > Team collaboration

## // EDUCATION

**redAcademy**  
Software Developer Sprinter  
2025 – Present

- C# & ASP.NET Core development
- React & TypeScript frontend
- API design & testing
- SQL / database fundamentals
- Agile project delivery
- Client project development
- Git & GitHub collaboration
- Technical documentation

## • USER • PROFILE

# Nazim Rafudeen

Backend-Focused Software Developer Sprinter

## // PROFILE

Backend-focused software developer with experience building client-facing web application MVPs using ASP.NET Core, React, TypeScript and Entity Framework Core. I focus on building maintainable systems through clean architecture, modular monolith design, clear domain boundaries and practical API development. I have contributed across requirements analysis, backend refactoring, frontend architecture, admin and applicant dashboard flows, mock authentication, data persistence and frontend/backend integration.

## // PROJECT LOG

**redAcademy — Software Developer Sprinter** 2025 – PRESENT  
Client project: **Financial Services Application Portal** • Cape Town, ZA

- Contributed to a client-facing web application MVP designed to digitise a manual application and onboarding workflow.
- Analysed an existing business process built on PDF forms, email submissions, spreadsheet-based processing and CSV export requirements, and helped translate it into a structured digital workflow.
- Contributed to early-stage requirements gathering, discovery sessions and business requirements documentation.
- Helped design and refactor backend structure using ASP.NET Core, Clean Architecture concepts, modular monolith principles and domain-driven design patterns.
- Worked on frontend architecture using React, TypeScript and Vite to support maintainable MVP components and user-facing application flows.
- Built and refined applicant-facing and admin-facing dashboard concepts for reviewing application status and managing submissions.
- Assisted with mock authentication, mock data persistence and frontend prototype flows to support stakeholder demonstrations ahead of full backend integration.
- Validated and resolved frontend/backend integration issues across API routes, expected response structures and local development environments.
- Helped stabilise Git branches, clean up repository structure, update version-control exclusions and prepare development work for merge into the main branch.
- Used Jira, GitHub, Swagger and local development tools to manage tasks, test features and collaborate across the project team.

## // TECHNICAL UPSKILLING

- + Completed structured upskilling in Clean Architecture, Onion Architecture, modular monolith design, CQRS and domain-driven design fundamentals.
- + Studied backend infrastructure concepts — reverse proxies, Nginx, Docker, Linux services, SSH and request flow.
- + Practised React and TypeScript fundamentals to support full-stack collaboration.
- + Built small technical demos and research exercises to deepen understanding of real-time communication patterns and runtime/system-level behaviour in C#.
